

Hobart Air Filtration Systems

Made of rapidly renewable natural wool, Hobart Air Filtration Systems keep your metal baffle filters and exhaust hood duct system virtually grease-free.

Wool is a natural grease attracter. Now Hobart uses wool in a filter system to collect nearly all the greasy particles that exhaust up into your hood system. It keeps filters, vents, duct system and roof almost grease-free, reducing labor, cleaning, maintenance and repair, while diminishing the threat of fire. It even helps keep the grease out of your HVACR and other rooftop systems, including fans and motors. The grease-absorbing capability of wool can also lengthen the interval between your scheduled professional cleaning and maintenance of vent hood systems. The Hobart Air Filtration System is ETL listed and is a "Recognized Component" and "Conforms to UL Std 1046" when installed in front of a UL 1046 metal baffle. ETL is nationally recognized by fire marshals, building inspectors and code officials for meeting product safety standards.

To see how Hobart Air Filtration Systems can help keep the grease out of your metal baffle filters, vents, duct system and off your roof, call your local Hobart Service representative at 888-4HOBART (888 446-2278) today.

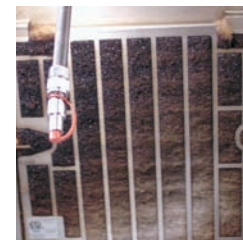

An hour or more vs. five minutes.

The Hobart Air Filtration System saves you time and money in so many ways. One of the most dramatic is the time you save on cleaning. It takes only a few minutes to change a Hobart Air Filtration System filter. Compare that to the ongoing washing of metal baffle filters: Taking down all the filters, itself a potentially hazardous task. Washing them with detergents, chemical degreasers or even pressure washers, all of which increase your water and chemical usage. Then climbing up to put the metal baffle filters back into the vent hood.

Instead, just replace the Hobart Air Filtration System filters when needed. Your metal baffle filters will be practically grease-free, with the upstream wool filter having stopped almost all the grease. Simply dispose of the filter, put on a new one, and replace the unit with the special Hobart tool. A few minutes. A big savings on time and materials.

before

after

Environmentally friendly

Both the wool filter and the grease it collects are entirely biodegradable, making it easy to dispose of. You just put it in with your regular trash.

Operator safety

A specially designed tool makes it easy to take the Hobart filter system in and out for changing. Your staff doesn't have to use stepladders or crouch above frying oil or other cooking equipment to remove your filters for cleaning.

Kitchen fires

The accumulation of grease up through your vent system is a significant fire hazard. An estimated 40% of all fires start in the kitchen*. Grease fires—quick to spread and difficult to extinguish—are a special dread for restaurant owners. By keeping your vent system relatively grease-free, the Hobart Air Filtration System helps reduce the risk of a devastating fire in your restaurant.

Degrease your rooftop

With all but no grease entering into your vent system, there is a similar reduction in grease on the roof. That can lead to a substantial savings in roof maintenance and repair.

*According to the National Fire Prevention Association, there are nearly 11,000 restaurant fires in the United States every year.
